Making Clean Energy Affordable for Everyone

Increase Other Fuel and Electricity Prices

"If fossil fuels cost enough, the incentive to research and produce other energy sources greatly increases. For example, Hawaii, because of the high oil prices in Hawaii the state is silently becoming 'one of the world's leading incubators of alternative energy.' [2] About 80% of the energy supply for the main utility in Hawaii comes from petroleum imports, which causes a big problem for energy prices when the price of oil zooms sky high. The average residential electricity rate on the island of Oahu, Hawaii has more than doubled since 1999 to 25.5 cents per kilowatt hour, which is coincidentally the highest electricity rate in the United States. So as fuel prices rise, the island is turning more and more to alternative sources of energy."
